INTRODUCTION

E10 FDM 3D printer can print CAD 3D printer model to real . E10 uses aluminum alloy to build its frame while it uses linear bearings , belts and threaded rods to build X , Y , Z axis .

It enables E10 to print steadily with no vibration .

Note:

1. All statement included in this Instructions have been checked carefully , if any typographical errors or misunderstanding , we have the final interpretation .
2. No noification if any update .

A. Security Considerations

To avoid danger when using 3D printer , please pay attention to precautions below .

Danger

During Operation , the maximum temperature of nozzle can be 260 °C while hotbed can be 100 °C . For your safety , during printing or cooling down , do not touch the nozzle , hotbed and models under printing . Power works at 110V/220V 50HZ AC and supply ground needed . Do not use other power supply , or it may cause components damage , fire or electric shock . And we take no responsibility for this .

Warning

We suggest wearing protective goggles when removing auxiliary support materials . Some filaments will emit slight irritant gases , so we suggest to use 3D printer in a ventilated environment .

Note: ABS filament will emit a bit toxic gases when it melts .

B. Product Details

1.Specifications

Model: E10	Nozzle diameter: 0.4mm
Layer thickness : 0.1-0.4mm	Machine size : 405*440*495mm
Printing speed : 40-120mm/s	Machine weight : 7.8KG
X Y axis position accuracy : 0.015mm	Packing size : 510mm*450mm*215mm
Z axis position accuracy: 0.004m	Gross weight : 9KG
Printing material: ABS,PLA	Build size : 220*270*300mm
Material tendency: PLA	LCD screen: 12864 LCD
Filament diameter : 1.75mm	Offline printing: SD CARD
Software language: Multi-Language	File format: STL、G-Code、OBJ
Function of support: automatically	OS: windows(linux、 mac)
Software: Cura	Working condition : 10-40°C , Humidity 20-50%

b. Software Installation Process

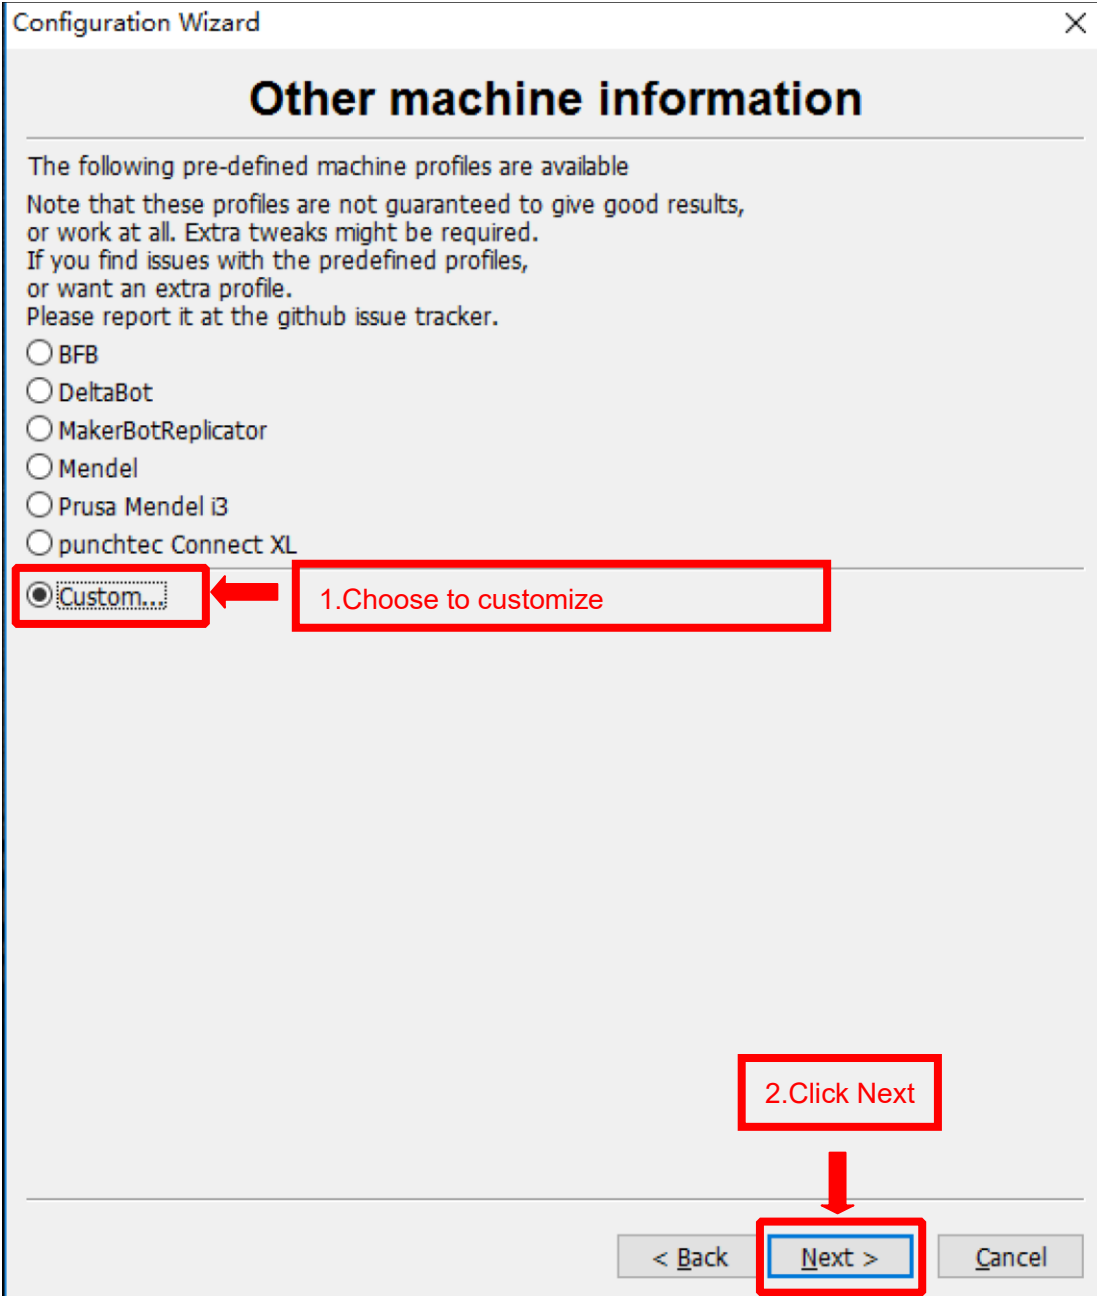

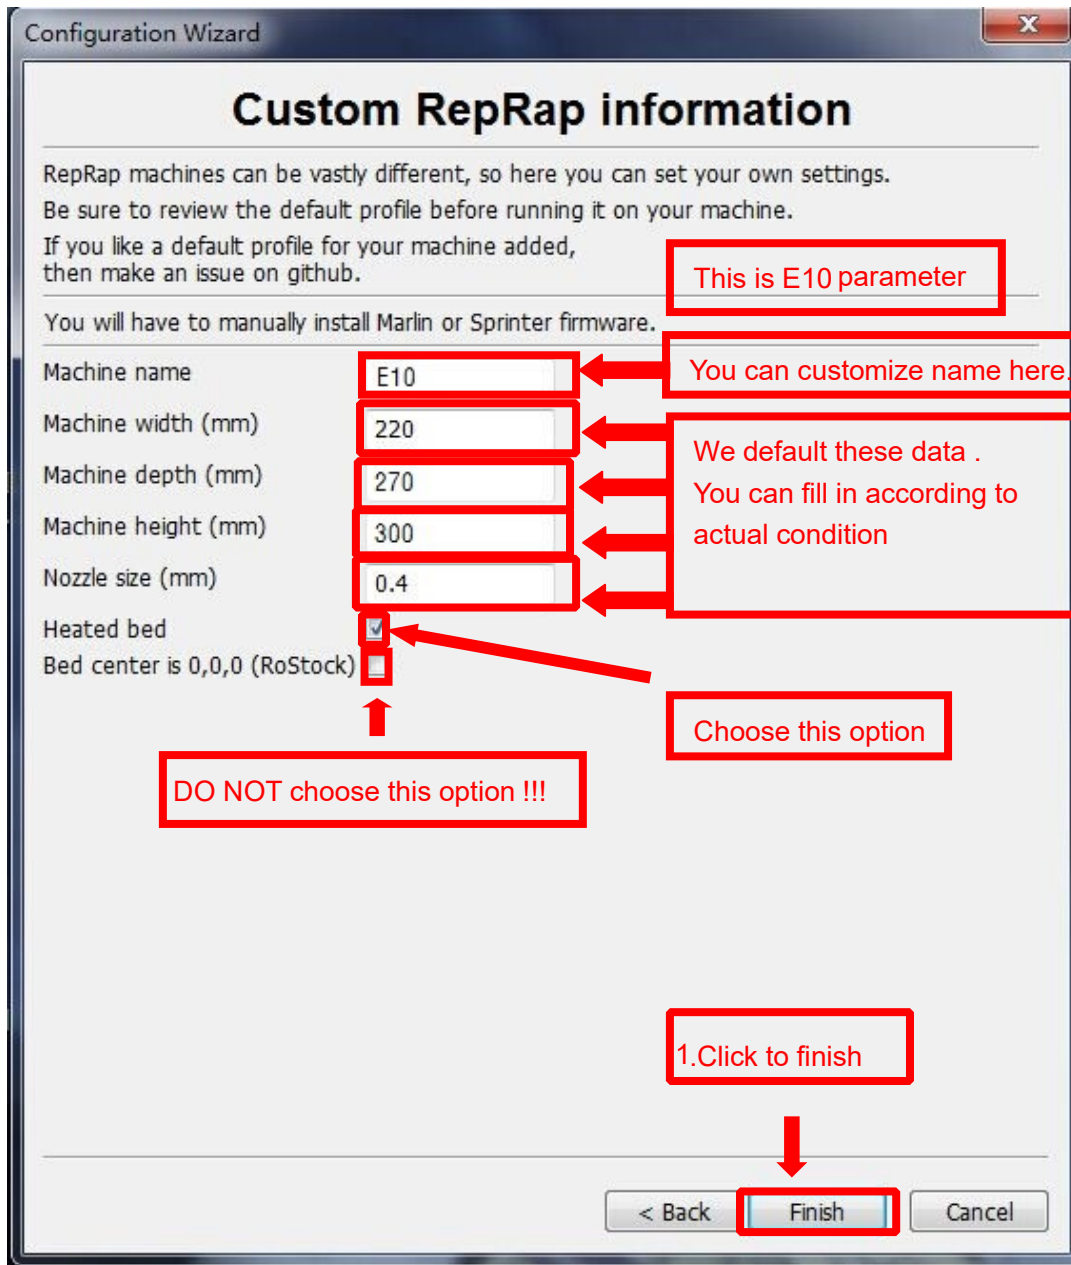

Now you have finished the installation. Next , enter Cura .

2. Cura Setting

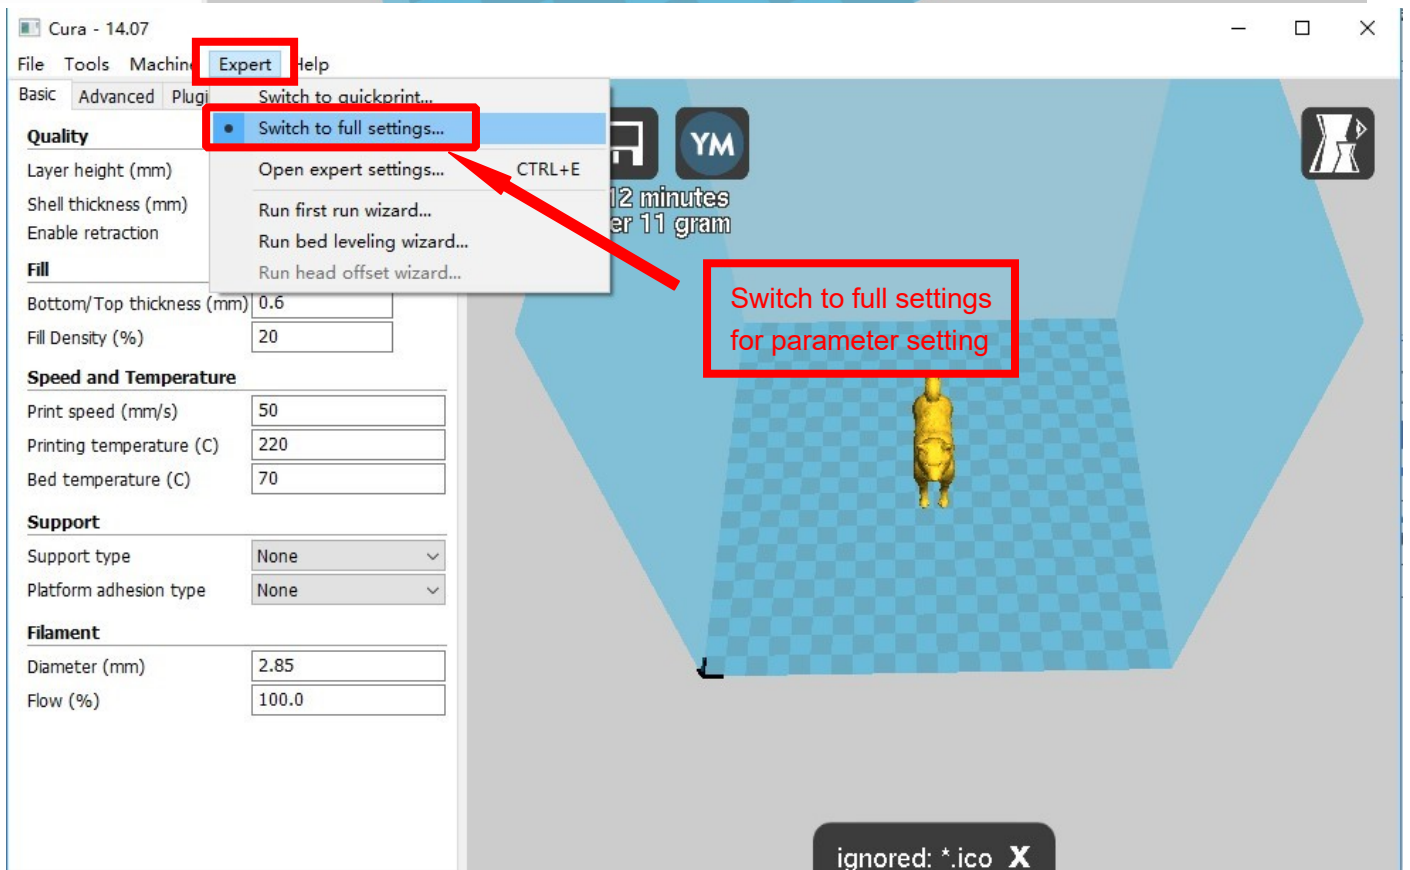

2.1 Clear platform

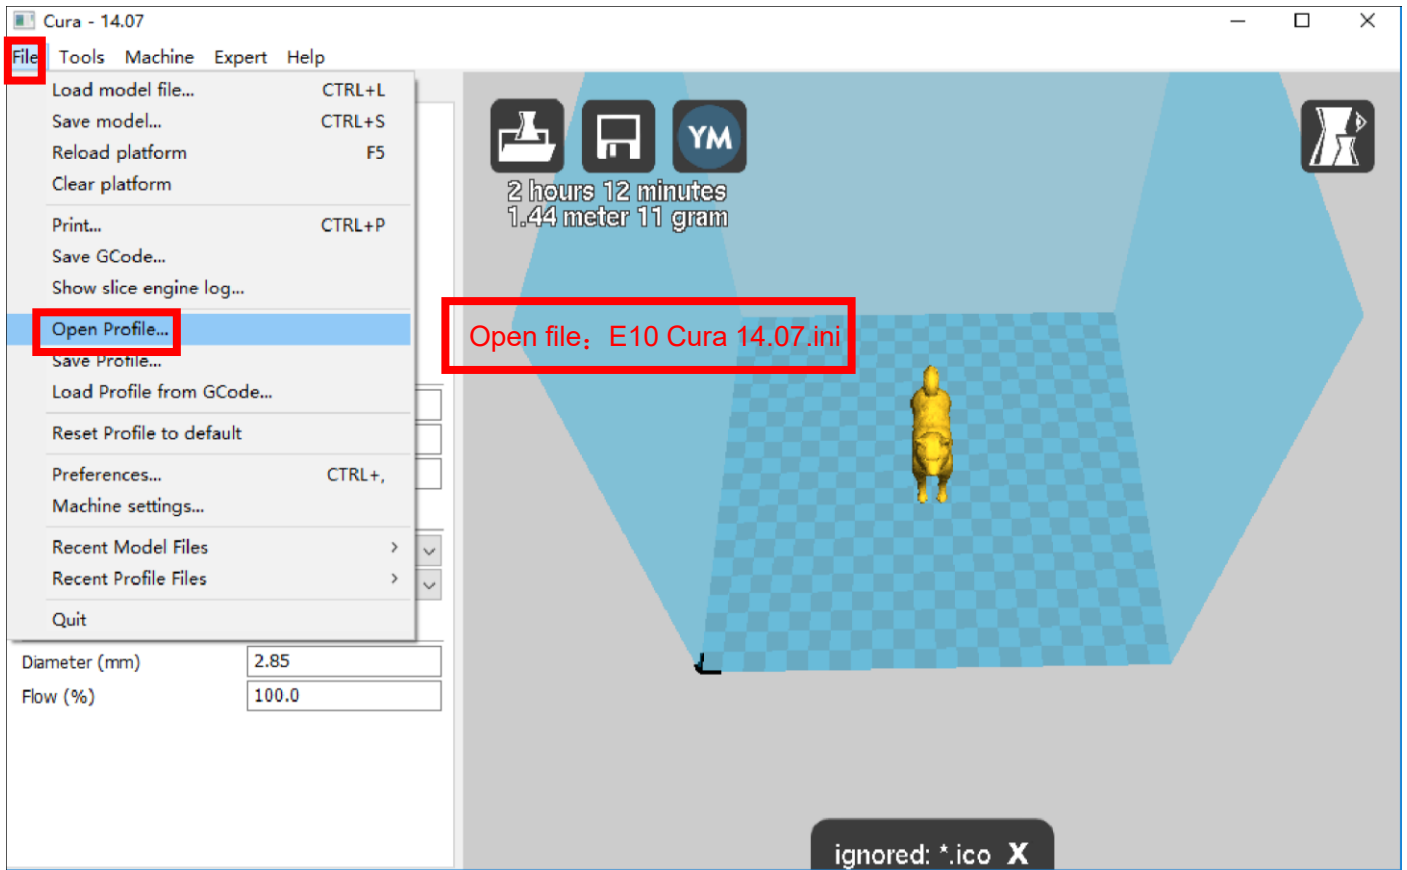

Delete the dog. Two ways for you :

1.Move mouse to dog ,right click, click “delete object”.

2. Left click "File", choose "Clear platform".

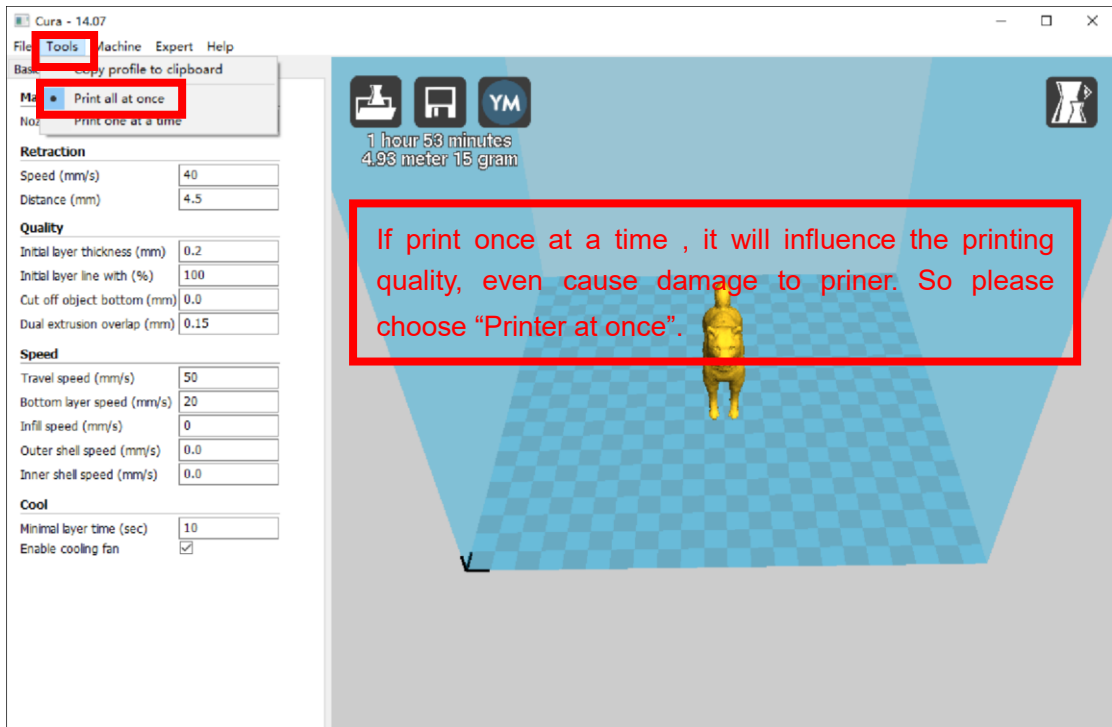

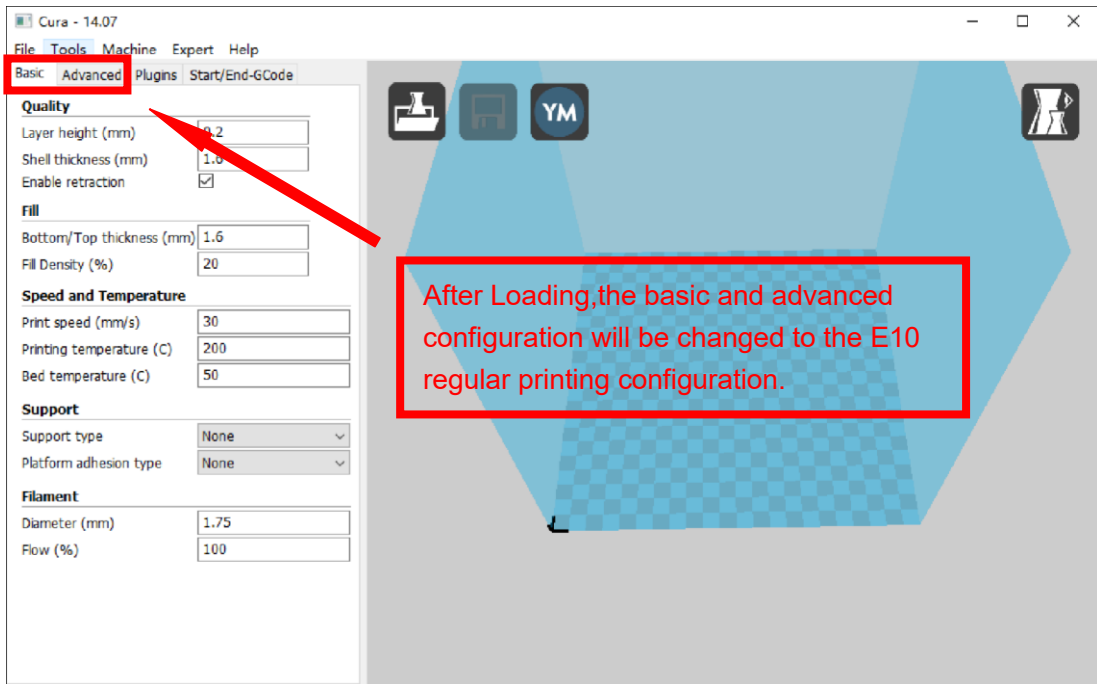

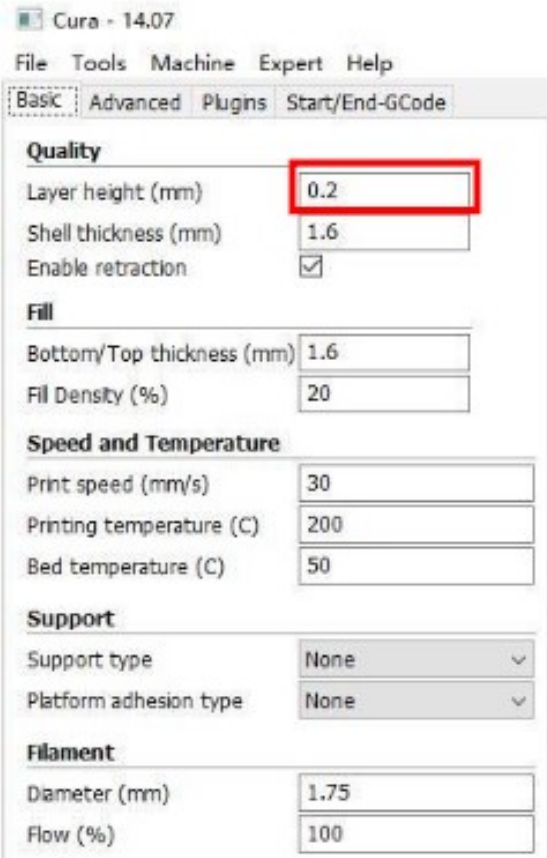

Position of configuration file: Computer/SD card)/ configuration file for cura-14.07

(suggestion :keep this file copy to your computer)

2.3 Layer height settings

Layer height : 0.1mm cost long time but have the best printing precision. 0.2mm cost half time compared to 0.1mm , but have general printing precision. 0.3 cost less time with not good precision. It defaults 0.2mm.

Left: 0.1mm
Layer height

Right: 0.2mm
Layer height

Layer height setting

0.8mm

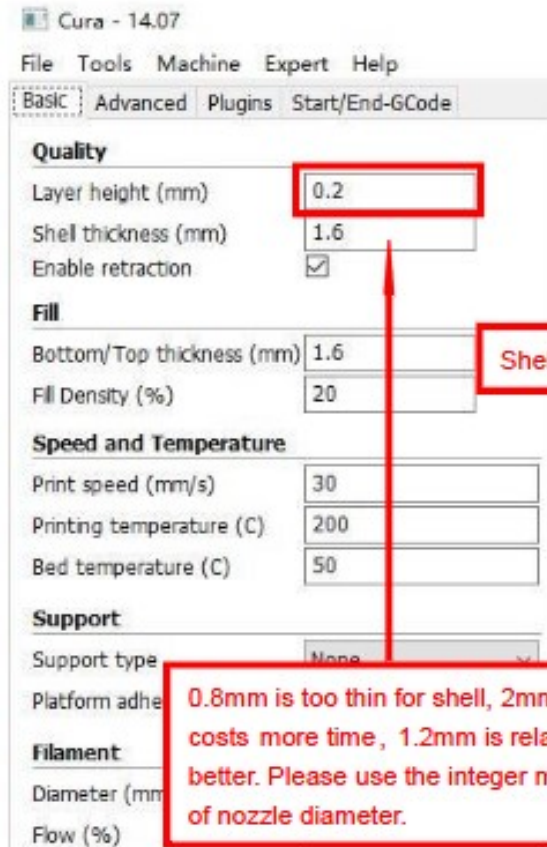

1.2mm

2mm

Shell thickness setting

0.8mm is too thin for shell, 2mm shell costs more time , 1.2mm is relatively better. Please use the integer multiple of nozzle diameter.

Quality

Layer height (mm) 0.2

Shell thickness (mm) 1.2

Enable retraction

Fill

Bottom/Top thickness (mm) 1.2

Fill Density (%) 20

Speed and Temperature

Print speed (mm/s) 30

Printing temperature (C) 200

Bed temperature (C) 50

Support

Support type None

Platform adhesion type None

Filament

Diameter (mm) 1.75

Flow (%) 100

Enable retraction to avoid filaments leakage when nozzles move in empty area

The Blue line is the leak filament

Enable retraction

Quality

Layer height (mm) 0.2

Shell thickness (mm) 1.2

Enable retraction

Fill

Bottom/Top thickness (mm) 1.2

Fill Density (%) 20

Speed and Temperature

Print speed (mm/s) 30

Printing temperature (C) 200

Bed temperature (C) 50

Support

Support type None

Platform adhesion type None

Filament

Diameter (mm) 1.75

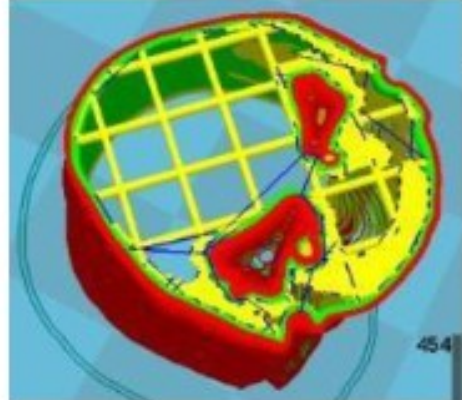

Flow (%) 100

When fill density is less than 20%, it's easy for 0.6mm thickness to cause hollow on the top. 1.2mm normally won't have this issue.

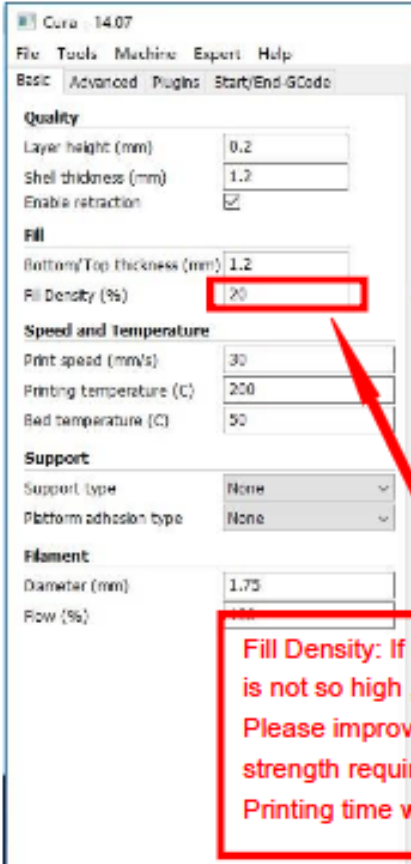

Bottom/Top thickness: 1.2mm

Under the same fill density

Bottom/Top thickness: 0.6mm

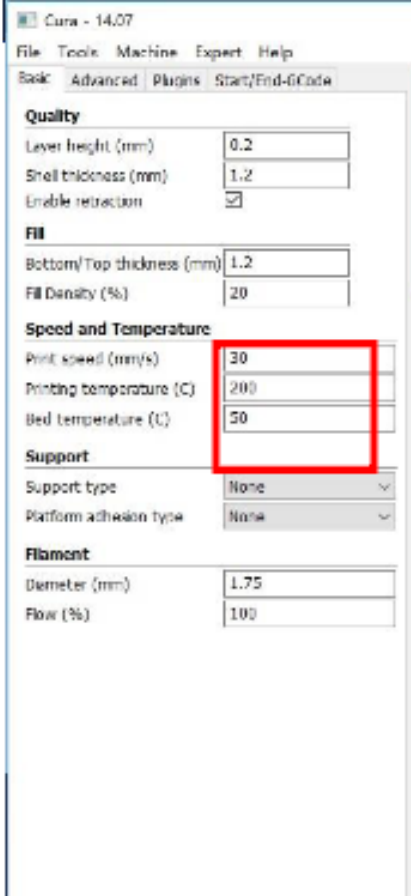

Bottom/Top thickness setting

Fill Density Setting

Printing Speed setting

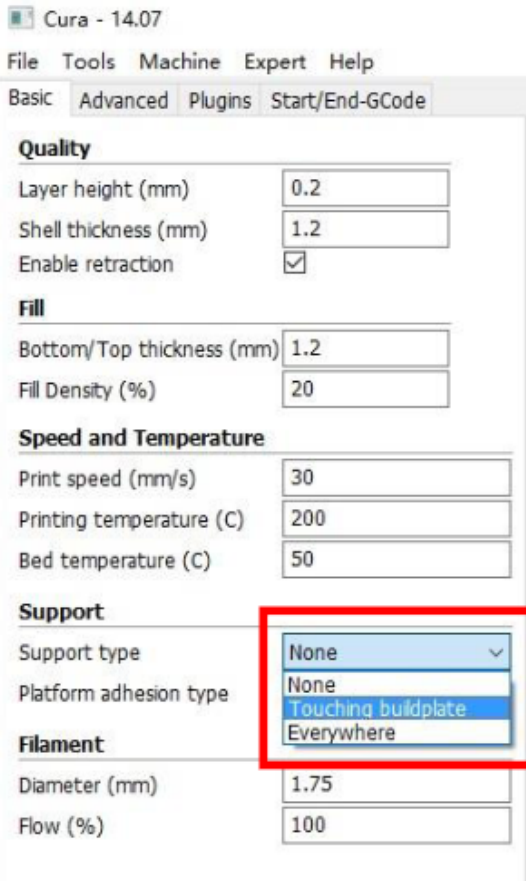

This is default speed. If other settings aren't changed, it prints more accurately while the printing process takes more time.

High printing speed takes less time while it cannot print accurately, making the model have bad quality. Normally 40-60 print speed is suitable for printing.

Printing Temperature

PLA filament temperature setting: nozzle: 190-210 °C hotbed: 40-60°C

ABS filament temperature setting: nozzle: 230-250°C hotbed: 60-90°C

Original Model

Support type: None

Support type: Touching

Support type: Everywhere

Support type setting

Attention: Normally we add support to complex model or model with vacant parts. It may have influence on the surface if you choose everywhere. You'd better circle around the model and try to avoid unnecessary support.

Support

Support type None

Platform adhesion type None

Filament

Diameter (mm)

Flow (%) 100

Support setting

None: no support

Brim: Touch with the edge

Raft: Totally touch with the bottom

Attention: please choose None if the printing platform is ready and the high temperature adhesive tape is good. Please choose Brim when the model is small . Choosing Raft makes it difficult to seperate model from the platform

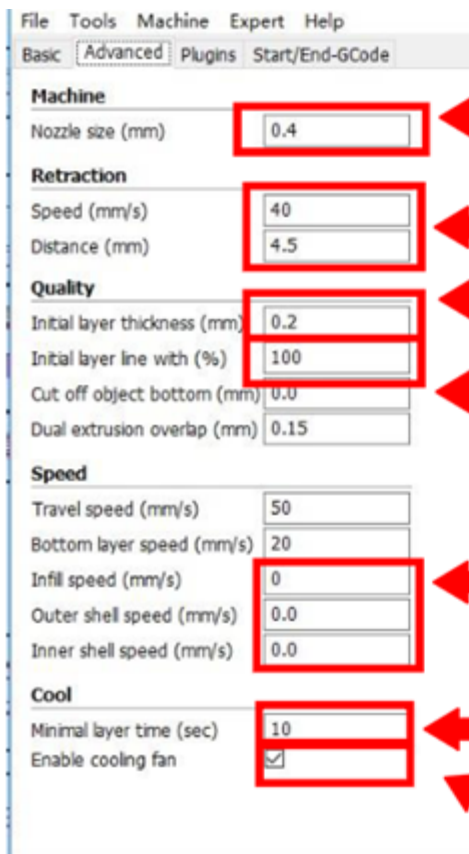

Attention: E10 use 1.75mm filament

Attention:

Flow is proportion of filament , we suggest to use 100
Increasing flow & decrease diameter has the similar effect.

Model surface gets many bumps when flow is too big;model frame gets flimsy if flow is too small.

We suggest not to change it , E10 default 0.4mm

We suggest not to change it , or use the date in the picture

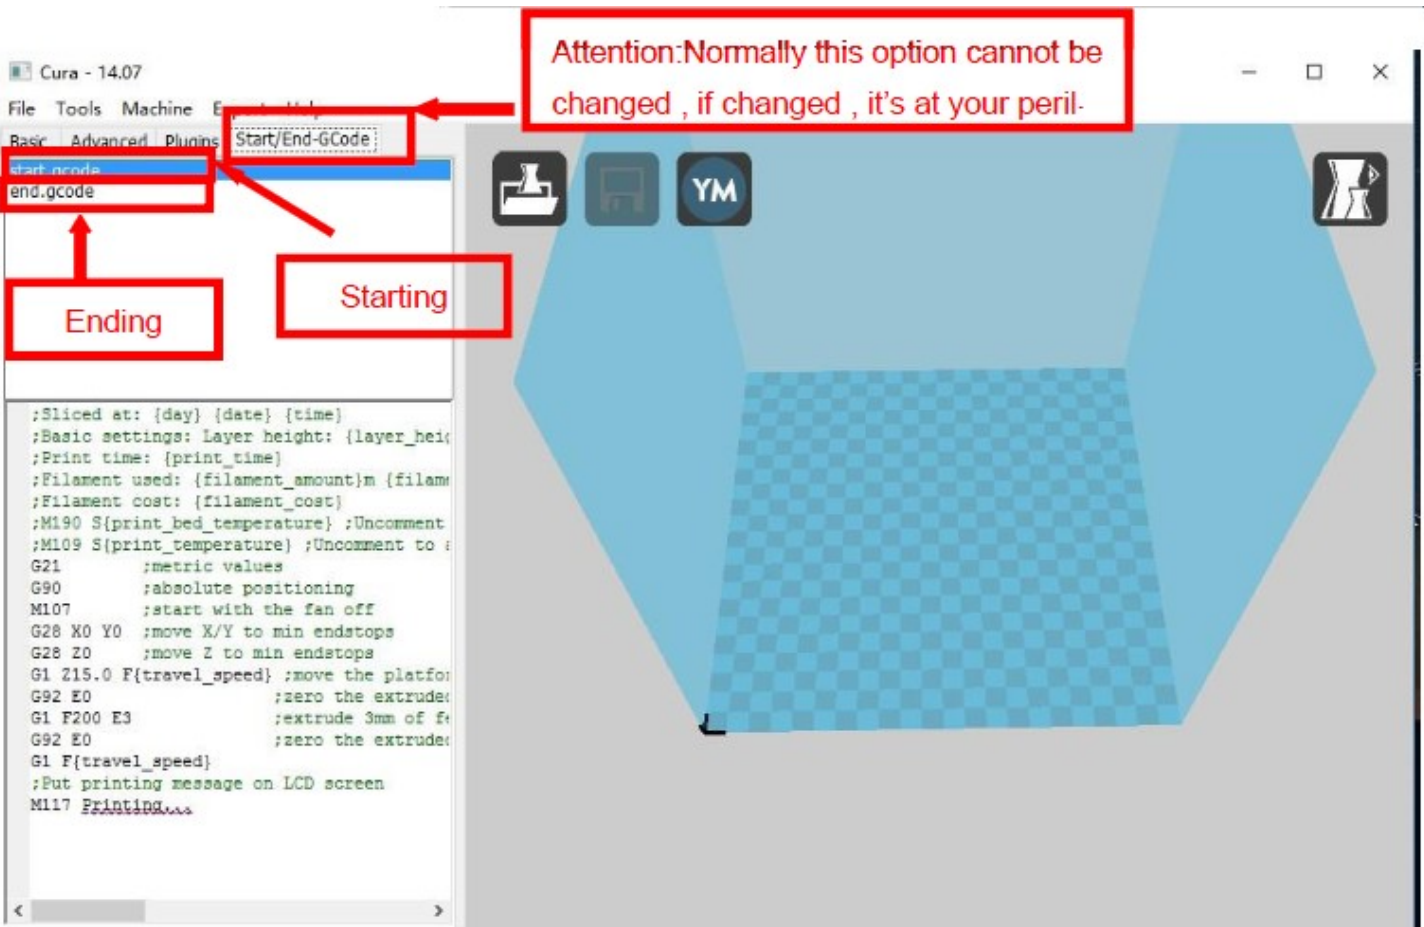

We suggest 0.2mm to avoid initial layer tilt,0.3mm is more easy to separate from the platform.

Initial layer line proportion

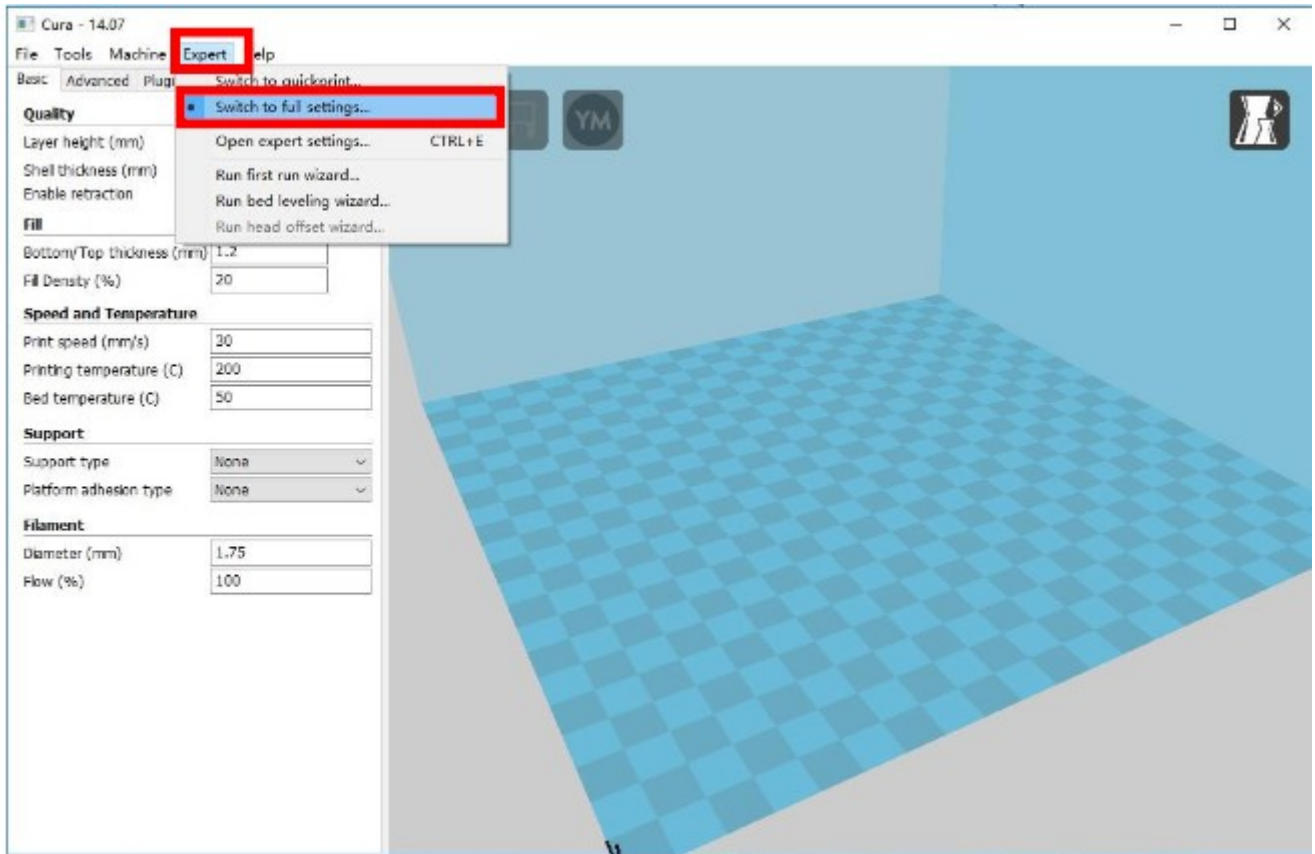

"0" means using default speed

Min printing time for each layer. When the time is less than 10 , it prints slower. It's better to decrease time when printing thin and long models.

We suggest not choose this when printing ABS.

Ok	

Skirt is to avoid extruder unfilled before printing , and it appears only when platform attachment type is None. Normally "1" is ok . Change it to "0" when your model reaches the maximum size , or the printing size will be too big.

Ok

1. To ensure the attachment of model to platform , fan won't start at the beginning.
- 2-4. Fan speed min & max : If they are not equal , the soft ware will choose a suitable speed during them.
5. Condition to choose cool head lift : When it's printing with the minimum speed but still cannot reach the minimum time , you need to choose cool head lift . But it may cause filament leak.

Ok

60°

45°

30°

It's difficult to separate if the distance between support and the supported place is too close; The surface will be influenced if the distance is too far.
 Different angle will generate different support , you can try the examples we provide above which will have different effect.

Ok

When choosing "Spiralize the outer contour" : Z axis rises while X,Y axis moves , and only a hollow bottom and a single layer of surface.

When choosing "Only follow mesh surface" : The nozzle prints along the surface.

Attention: The software defaults not open the option above , you'd better not turn it on .

Ok

Guidance to use Raft if needed: Expert → Expert Settings → Support → Support Types → Raft.

The images above are only for reference , please set the parameter according to actual requirement.

Left click the model and you will see the icon of "whirling, scaling, mirroring."

Left click to select model and move → move model.
 Slide mouse wheel → scaling.
 Right click to select model and move → whirling.
 Shift + right click platform and move → move platform

Normal: Most used.

Overhang: Used to see the vacant part.

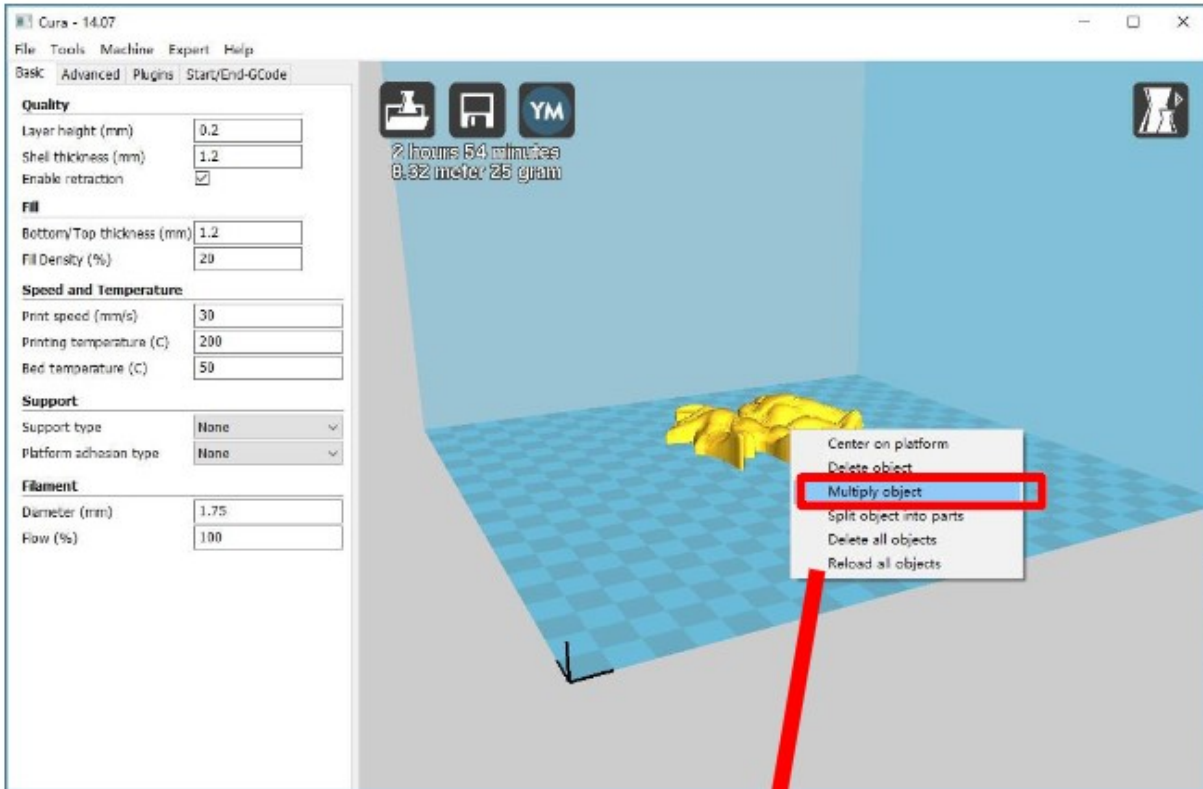

Transparent

X-Ray

Layers: Used to simulate the effect of each layer and the path.

Right click model → Left click "Multiply object" → Example: copy 4 model

5 models in total

Attention: You can try other functions by yourself.

D. Printing Operation

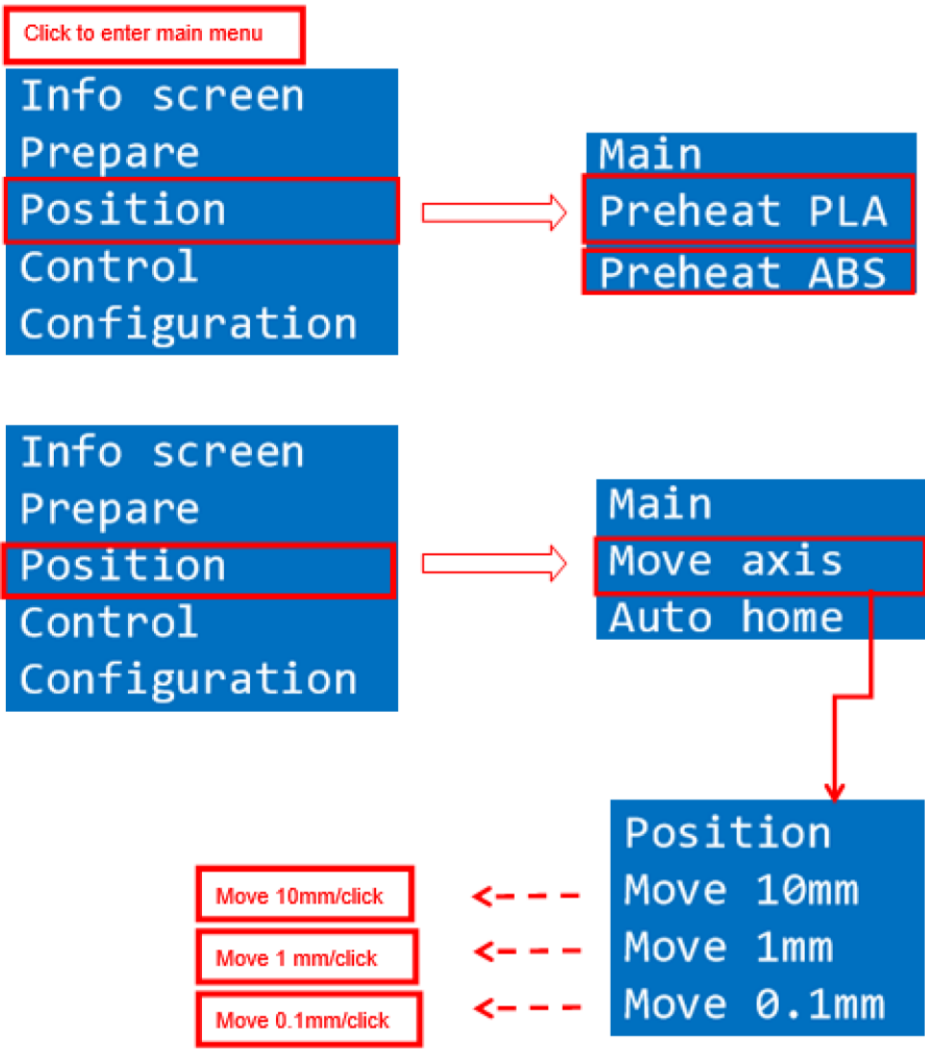

1. Display Introduction

Click to enter main menu

Main menu

Info screen
Prepare
Position
Control
Configuration
Print from SD
Change SD card

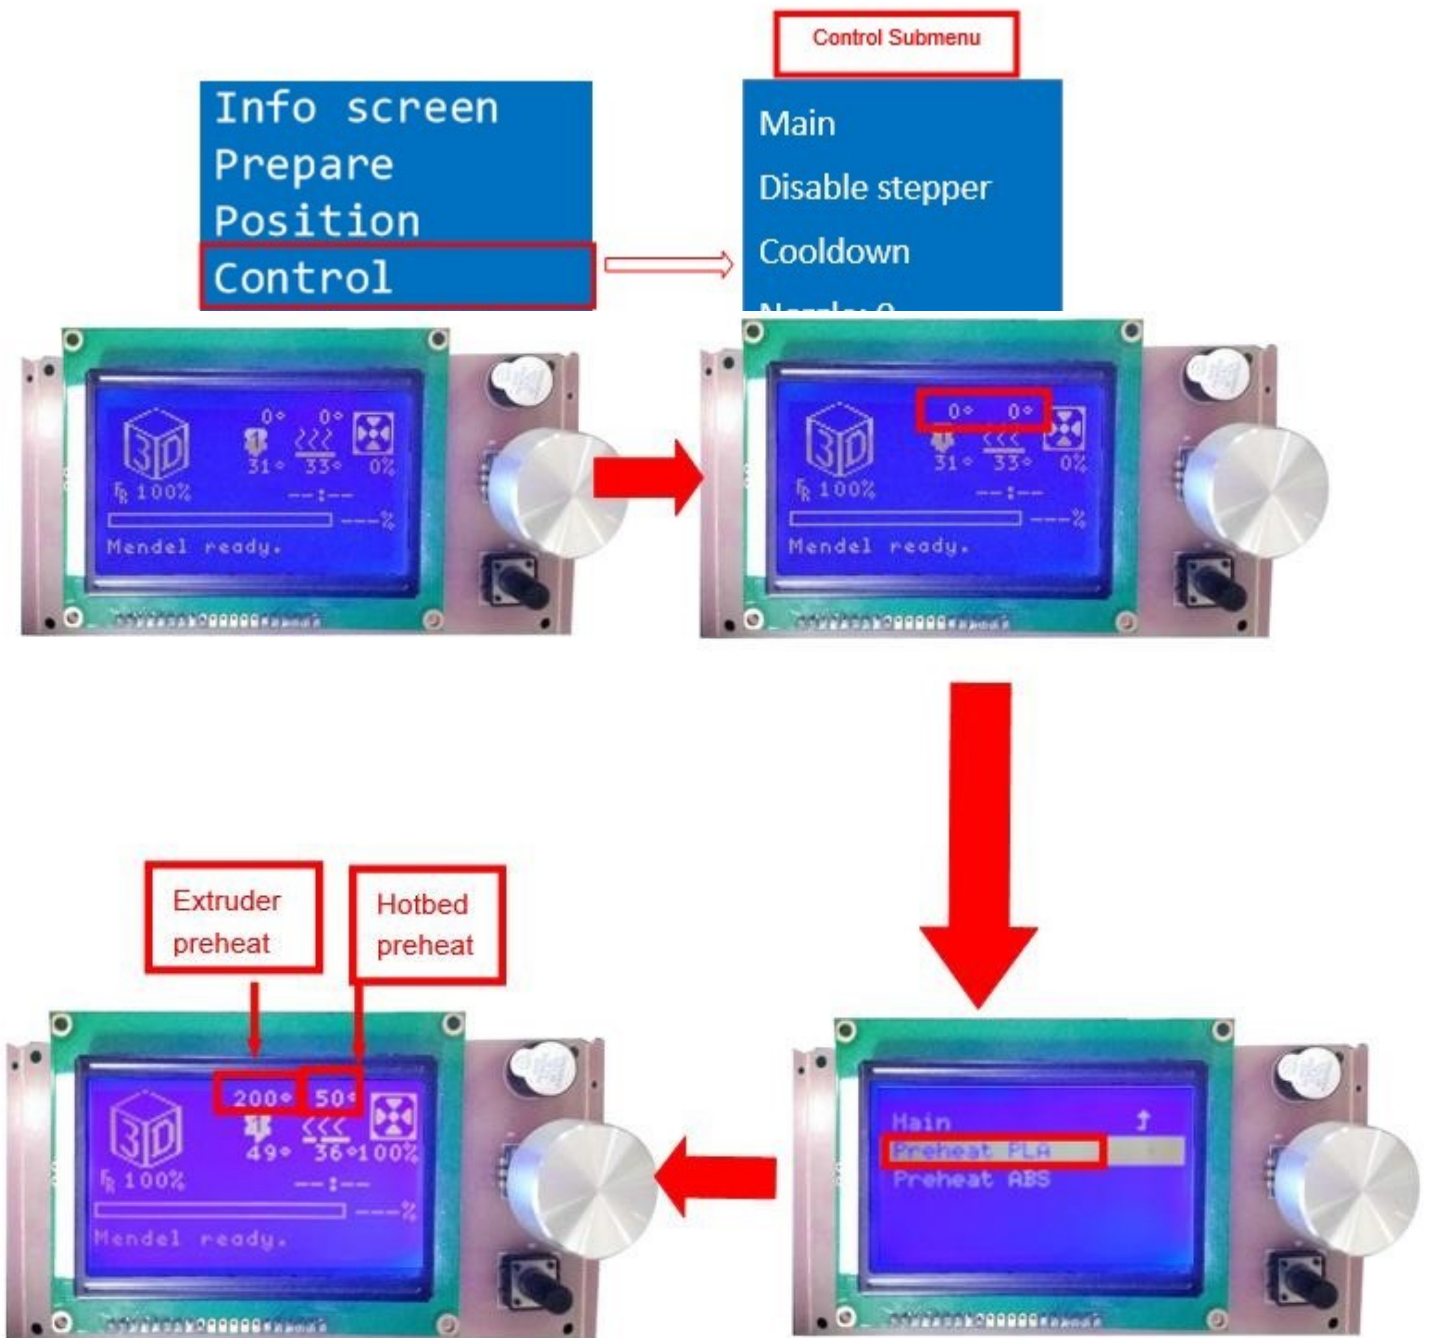

2.Filament Feeding

2.1 Set Preheat

Attention: Before filament installation, we need to preheat. Use PLA as example .

Press Knobs → Prepare → Preheat PAL → Start preheating

Attention: Please choose "Preheat ABS" if you want to print with ABS

2.2 Filament Installation

Attention: only when extruder temp reaches 200°C can we put filament in the printer.

Confirm Extruder Temp has reached 200°C → 1 roll PLA → Stroke the filament head straight → Press extruder screw. Meanwhile, hold the white wind mouth → Meanwhile, stick filament into the extruder quickly until filament goes out from the nozzle → Filament installation succeed

②

Attention: install filament only when temp reaches 200°C

③

Stroke the filament head straight → Press extruder screw. Meanwhile, hold the white wind mouth → Meanwhile, install filament into the extruder quickly until filament liquid goes out from the nozzle

Use the thumb to press the screw head of extruder, use index finger to hold the base of extruder head push the filament until the filament is appear to the bottom of the nozzle head

If the filament in the bellow of nozzle is squeezed evenly, then the filament is installed successfully.

When you needs change the filament or do not use 3d printer for long time, we now introduce how to pull out filament.

The way of pull back filament (PLA as an example):

1. Please preheat the printer to 200 degrees;
2. When reach 200 degrees, pls push the filament down to send a section of filament to extruder, and then plug up the filament quickly, the thumb press the extruder head, the index finger to hold the base, while the other hand just pull the filament out ;
3. Then install the filament according to the method of "filament installation ".

Note for filament installation :

1. When a roll of filament id near to be run out , in order to avoid that you can't pull the filament out which will cause problems for filament installation. Pls Remember not to let the filament be eaten by the machine, so pls install the filament timely;
2. When replacing a new filament, you need to preheat the printer firstly, then press the compression spring by hand, push down the filament , then pull it up again. Remember not hard pull, cold drawn so as to avoid damage to the nozzle can not be repaired

3.Platform Adjustment

1. Choose "Position" → "Auto home" , printer will move to limited switch until it stops.

2. Turn off stepper motor: based on step 1 , enter "Quick settings" → "Disable stepper"

3. Please manually move nozzle to platform and check the gap between nozzle and platform.

4. When the gap is more than 2mm, you need to adjust the height of Z limited switch.

Example: When the gap is 12mm, you need to adjust limited switch down by 10mm. The rest 2mm can adjust by spring on the hotbed.

After adjustment of springs, reset printer and close stepper motor to test. Use A4 paper to test the gap.

Tips: When you are familiar with the printer with time going by, we can adjust while it's printing. It's because the printing speed is slow at the beginning so that there's enough time for adjustment. Meanwhile, the printing effect will be better.

4. Printing

1) SD Card Offline Printing

a. Loading mode

Cura supports STL file & G-code file.

b. Code Saving

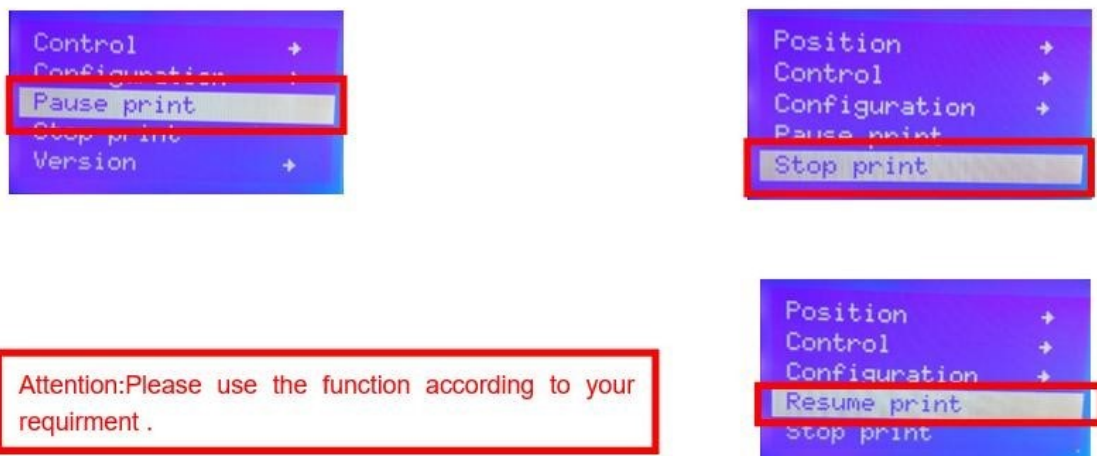

Copy file to SD card . Then connect SD card to printer, click reset. Picture below shows the location of print file , there are 2 methods to find print file.

c. Introduction of Stop print , Pause print , Continue Print:

Only when the printer is printing can we use Stop print, Pause print, Continue Print.

d. Judgment of the gap between nozzle and platform.

1. Too big gap: The printed model is uneven, curled with gap. It means the gap is too big for filament to reach the platform, making the printing effect so bad.

2. Too close gap: The printed model edge has irregular projections. It means the gap is too close to print normally. Sometimes it even cannot output filament

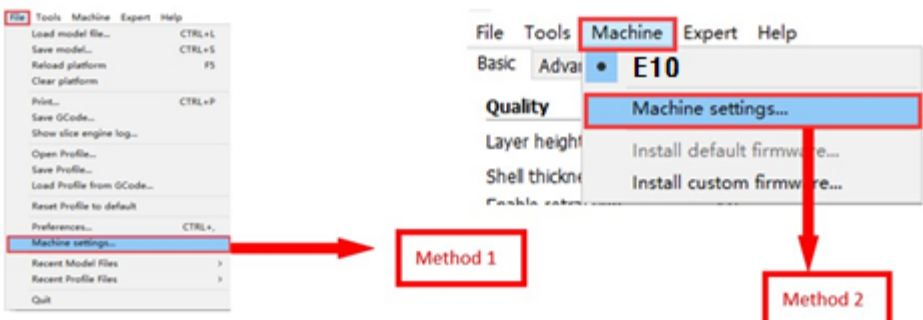

3. Appropriate distance: Printed model flat with no gap, no glitches. It means the distance is appropriate to print

Wait to print complete after gap adjustment.

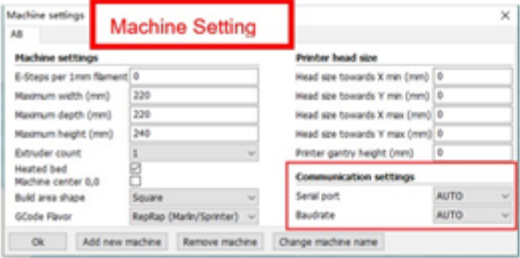

2) USB Online Printing

a. Machine settings (Use USB to connect to PC)

Method 1

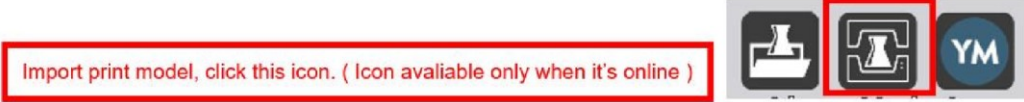

Method 2

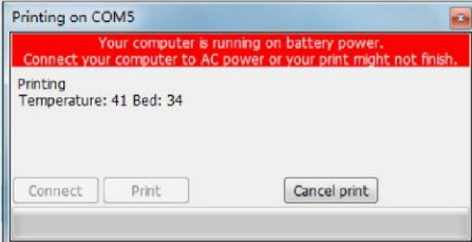

Machine Setting

Modify serial number(serial port determined by computer),modify baud rate(usually 115200)
When online printing, you need to use USB to connect with PC and set serial port, baudrate correctly.

b. Online Printing

Import print model, click this icon. (Icon available only when it's online)

Printing on COM5

Your computer is running on battery power.
Connect your computer to AC power or your print might not finish.

Printing
Temperature: 41 Bed: 34

Connect Print Cancel print

Printing on COM5

Your computer is running on battery power.
Connect your computer to AC power or your print might not finish.

Operational
Temperature: 0

Connect Print Cancel print

The printer will start printing automatically when the extruder & hotbed reaches estimated temp after you choose print model. You can also modify temp in this interface.

E. FAQ

1. Z Axis Adjustment

During installation, we need to test moving parts:

1.

Preparation: Before Z axis moving adjustment, please confirm the height of both Z axis screw support is the same. (Keep the same height of two white parts)

Specific practice: using the straight ruler rules out the height of both sides of Z-axis screw nut support frame , rotating the flexible couplings in both side till they having same height. Which shows like picture.

2. Adjust concentricity

1. Click to adjust Z axis to move (Position \rightarrow Z pos.Fast \rightarrow +/-). If it cannot move smoothly, you need to adjust the unsmooth side's screw support. Try to keep them at the same height.
2. We can also tight/loose the Z motor screw according to requirements. This is to correct the deviation in the first time installation. Please take steps as follows to lock screws,

Lock the nuts

Brass nuts

Lock the nuts

Brass nuts

Z axis left screw support Z axis right screw support

More , We also loose the Z-axis motor and lock the nuts and then lock the Z-axis motor again to correct the error happened in the first process. Notice ,when you lock the Z-axis motor pls make light cross-lock, and tight it at the second process.

Z-axis MOTOR

Flexible coupling

Z motor & Flexible bearing

1.Nozzle blocking

Warm Tip: For a better illustration, we already remove the extruder cover and cooling fan, material tube in the picture, customer can determine whether to break down the hot fan or not according to the actual situation.

little filament left in the nozzle would be difficult to take out

Left filament on the bellow the nozzle

Operation

- Info Screen ↑
- Prepare +
- Position +
- Control +
- Configuration +

Choose Preheat(PLA as example)and wait temp to rise

- Main ↑
- Preheat PLA
- Preheat ABS

Let the filament be drawn in the throat hole

Using the best small Hexagon wrench or pieces of filament (1.75mm) to extrude the residual filament until the nozzle having no filament any more.

3.FAQ

No.	Symptom	Reason	Method
1	Print model dislocation	Synchronous wheel/belt loose.	Tighten set screws or fasten belt
2	Glitch with the print model	Too high temp or slicing problem.	Extruder temp is too high and retracting speed & distance is too small
3	Foamy print model	Low temp or not smooth filament entering.	Rise extruder temp or check if brass nut and bearing is good. Replace a nozzle if methods above can't solve the problem.
4	Printer model is warped	Hotbed level isn't well adjusted.	Adjust hotbed
5	Unavailable G-code transformation	Wrong setting/wrong save path	Choose right machine type and change the right path
6	Software installation failed	Different OS	Reset OS
7	Unusual temp	Broken temp sensor	Change a new one

4. Maintenance

Important maintenance tips:

1. maintenance of X,Y,Z axis: Add some lubricants on the rods to reduce friction when the machine works noisy and a little bit shake.
2. Please refer to the USER MANUAL before printing, do preparation of hot bed adjustment first.
3. When finished printing, the filament should keep sealing, avoid moisture.
4. Preheat the extruder at the beginning of 2 nd time printing, let extruder auto-push filament for a while.
5. Machine should do some regular maintenance, drop some lubricating oil on thread rod, polished rod and bearings to avoid fatigue wear.
6. Do not let the fan and air-condition blow to the hot bed when printing.
7. Keep the working condition at “Temp:10-30℃, Humidity:20-70%”.

5. Maintenance Service Provision

1. This product executes regulations of “Product Warranty Card”.
2. Please contact supplier or customer service if the product have any problems . Do not repair it by yourself, otherwise you need to bear all the consequences.
